

INSTALLATION INSTRUCTIONS

WARNING: NEVER EXCEED YOUR VEHICLE MANUFACTURER'S RECOMMENDED TOWING CAPACITY

BOLT-TOGETHER WEIGHT DISTRIBUTION

WEIGHT RATINGS

CAUTION: The tongue weight rating of the spring bars represents the capacity of a pair of bars, not an individual bar. Always use a pair of spring bars and be sure they are of the same weight rating.

Part#	Gross Trailer Weight	Tongue Weight
Without Spring Bars		
17345	Not to exceed 2,000 lbs.*	Not to exceed 200 lbs.*
With Spring Bars		
17345	3,000 - 5,000 lbs.	300 - 500 lbs.
* When spring bars are not used, the weight rating is dependent upon the trailer ball manufacturer's weight ratings. Do not exceed the maximum weight rating of the trailer ball.		

MAINTENANCE

Keep the socket-mounted ends of the spring bars and the lock pins in the head assembly free from dirt and well lubricated. Excessive wear in this area may indicate an overload or inadequate lubrication.

Keep the head assembly exterior clean. Do not allow dirt or stones to lodge between the spring bars and the head.

Keep hitch parts painted to prevent rust and maintain good appearance. Do not paint over labels.

Keep lift brackets clean and lubricated to ensure ease of operation.

WARNINGS

The loaded ball height should never be greater than the uncoupled ball height. Front wheel overload and loss of rear wheel traction can result and can lead to unstable handling. It can reduce braking ability and create a tendency to jackknife when turning or braking at the same time.

If the loaded trailer ball height is greater than the uncoupled height, reduce take up on the spring bar chains, re-measure and adjust until the proper height is obtained.

CAUTION: If the lift chain is angled fore or aft at the top within the lift bracket, it may catch on the bracket when turning. This could damage the lift bracket or pry it open.

Figure 1

PARTS LIST

Item#	Qty	Description
1	1	Head assembly
2	1	Shank assembly
3	2	Spring bar assembly
4	2	Lift bracket
5	1	Lift handle
6	1	Hitch pin
7	5	Clip
8	2	Clevis pin
9	1	Pin, 1/2" x 1 1/4"
10	3	Hardened washer
11	2	Hex-bolt, partially threaded, 1/2" x 3 1/2"
12	2	Hex-bolt, fully threaded, 1/2" x 3 1/2"
13	4	Conical washer, 1/2"
14	2	Locknut, 1/2"
15	2	U-bolt, 3/8"
16	4	Locknut, 3/8"
17	4	Flat washer, 3/8"
18	2	Lift chains

ASSEMBLY

Measure trailer coupler height

Line up the tow vehicle and trailer on level pavement, in a straight position. Use the trailer tongue jack to level the trailer. Measure the distance from pavement to the top of the coupler socket and record here _____

Figure 2

Measure the tow vehicle

For vehicles with air springs, air shocks or automatic leveling systems only, check the vehicle's owners manual or other instructions on these items. Unless otherwise indicated, air springs and air shocks should be deflated to their minimum recommended pressure before assembling and adjusting the weight distributing hitch.

Pick reference points on the front and rear bumper of the towing vehicle. Measure and record height to pavement.

Front bumper to pavement _____

Rear bumper to pavement _____

Determine the 'target' uncoupled ball height for the tow vehicle

Tow vehicle's uncoupled ball height will be set higher than the coupler height measured in Step 2 to allow for vehicle squat when coupled to trailer.

For passenger cars, add 1/8" for each 100 lbs. of tongue weight. Record ball height _____

Install shank, hitch head and ball

Step 1

Insert shank (#2) into receiver tube on tow vehicle and secure with hitch pin & clip.

Figure 3

NOTE: To obtain proper ball height on high ground clearance vehicles, shank may be inverted as shown in Figure 3. If shank is used in an inverted position, check for adequate ground clearance.

Step 2

Select a trailer ball to match the trailer coupler socket, having a 1" threaded shank and capacity exceeding the gross trailer weight. Install ball and tighten, securing nut to the trailer ball manufacturer's specified torque.

Step 3

Position head assembly on shank. Slide head up or down to the nearest bolt hole alignment position which corresponds with the target ball height determined earlier. Mark the position on the shank. See Figure 4.

Figure 4

Step 4

Place two hardened washers (#10) on pin (#9) and insert pin into the unthreaded hole in the upper portion of the head channel. The number of washers may have to be changed later.

Step 5

Install the head on shank at marked position. Insert the 1/2" x 3 1/4" hex bolt (#11) through the conical washer (#13) and then through the lower hole in the head channel. Rotate the head forward as far as it will go. The ball should be vertical or tilted slightly back. If it is not, remove the 1/2" bolt, change the number of washers on the pin and re-assemble. Install the remaining 1/2" x 3 1/4" bolt (#11) with conical washer (#13) through the upper slotted hole. Install a second conical washer (#13) on both bolts. Start locknuts (#14) and finger tighten only.

Step 6

Tighten bolt (#11) just enough to hold head tight against the pin in the head channel. This bolt will be tightened later.

Step 7

Place head assembly back into hitch assembly on towing vehicle.

Assemble, lubricate and install spring bars

Assemble the lift chains (#18) to the tapered ends of each spring bar using the 3/8" U-bolts (#15), 3/8" flat washers (#17) and the 3/8" hex locknuts (#16) as shown below in Figure 5. Let two or three threads of the U-bolts extend out through the bottom of each locknut. See Figure 6. The chain must be free to move in the U-bolt (#15).

Apply a heavy, fibrous grease to the top, bottom and inner section of each trunnion on the spring bars as shown in Figure 5.

Position the trunnion end of each spring bar between the upper and lower flange plate of the head assembly. Drop clevis pin (#8) down through the head and trunnion and secure clevis pin with clip (#7) below the lower flange plate of head assembly. Position the connected spring bars back along the trailer tongue.

Attaching the trailer to the ball

Using the trailer tongue jack, lower the coupler onto the trailer ball and close coupler latch. Do not retract jack fully at this time. Allow the jack to support some of the tongue weight.

Raise the front of the trailer and back of the tow vehicle approximately 3" with tongue jack. This will allow easier installation of the chains on to the hook of each lift bracket.

Installing the chain lift brackets

The following applies to trailers with an 'A' frame tongue.

Step 1

Position the spring bar, which has been attached to the hitch head, parallel with the trailer tongue. Hold the lift chain vertical up alongside the trailer tongue. Position the lift bracket on the trailer tongue so that the chain is centered between the lift bracket, as shown below in Figure 7. Some trailers may have an obstruction on one side of the frame. Order the offset lift bracket kit from your local dealer. Follow the installation instructions supplied with that kit to install this special bracket.

CAUTION: If chain is angled fore or aft at the top within the lift bracket, it may catch on the lift bracket when trailer is turning. This could damage the lift bracket or pry it open.

Step 2

Mark the location of the lift bracket on the trailer tongue.

Step 3

Install the 1/2" x 3 1/2" full-thread bolt (#12) into the threaded hole in the lift bracket. Turn the bolt in until it contacts the trailer tongue, then tighten a 1/4 turn with a wrench. Do not overtighten.

The amount of leveling is adjusted by engaging different spring bar chain links with the lift unit. Follow the steps below in the "Lift bracket operation" section.

Lift bracket operation

Before raising or lowering the lift bracket, raise the front of the trailer to reduce the spring bar chain tension. This will make the lift bracket operation easier and safer.

WARNING: Keep clear of the pivot path of all moving parts when there is tension on the spring bar chain. Maintain control of the lift handle at all times when raising or lowering the spring bar. Be sure that the locking hair pin is in place once lift bracket is in the up position.

To raise life bracket

Step 1

Slip the marked chain link over the hook on lift bracket. See Figure 8.

Step 2

Insert lift handle onto heavier rod above lift chain attachment.

Step 3

Using the handle, raise the lift bracket up and over center so that it is fully seated against the mounting bracket.

Step 4

Secure by inserting clip through the lift bracket and mounting bracket. **NOTE:** Be sure the chain is not twisted and hook extends through the link.

Figure 8

To lower from fully raised and locked position

Step 1

Remove the locking pin from lift bracket.

Step 2

Insert lift handle onto the rod above lift chain attachment.

Step 3

Carefully lower bracket with handle. It will require effort to bring the bracket over center and then to resist the chain tension as the bracket rotates downward.

Check vehicle height and adjust spring bars if necessary

Vehicle should settle evenly, within 1/2". Re-measure the front and rear bumper reference points. If the front has settled much more than the rear, increase the number of chain links between the lift bracket and the spring bar. The spring bars should be nearly horizontal when correct height is achieved.

When even settling and correct spring bar position have been achieved, mark the spring bar chain at the hooked position with paint for future hook up reference.

NOTE: Figures 9 and 10 show the correct and incorrect hook-up position of the spring bars. To allow movement when turning, there should be at least five links between the lift bracket and the spring bar. The number of links should be the same on both bars. Adjust head tilt to accomplish correct chain length.

Figure 9

Figure 10

Tighten 1/2" head attachment bolts to 75 ft. lbs. torque. Failure to tighten bolts may result in fastener loss or failure.

Insert the locking pin through the lift bracket and mounting bracket.

TOWING TIPS

Driving a tow vehicle

Good habits for normal driving need extra emphasis when towing a trailer. The additional weight of the trailer affects acceleration and braking. Extra time should be allowed for passing, stopping and changing lanes. Signal well in advance of a maneuver to let other drivers know your intentions. Severe bumps and badly undulating roads can damage your towing vehicle, hitch and trailer, and should be negotiated at a slow, steady speed. If any part of your towing system bottoms out or if you suspect damage may have occurred in any way, pull over and make a thorough inspection. Correct any problems before resuming travel.

Check your equipment

Periodically check the condition of all your towing equipment and keep in top condition.

Trailer loading

Proper trailer loading is very important. Heavy items should be placed close to the floor near the trailer axle center line. The load should be balanced side to side and firmly secured in the trailer to prevent shifting. Tongue weight should be 10-15% or the gross trailer weight for most trailers. Too low a tongue weight often produces tendency to sway.

Sway control

A sway control device is recommended, as it can help minimize the effects of sudden maneuvers, wind gusts and buffeting caused by passing vehicles. Use of a sway control device is recommended for trailers with a large surface area, such as travel trailers. This head assembly will accept two sway control attachment balls.

Check all trailer to towing vehicle connections for security and operation

Surge brakes require a small amount of fore and aft movement for their actuating mechanism to function correctly. To avoid restricting movement, it may be necessary to increase the number of chain links between the lift brackets and spring bars, by tilting the head down. Tighten the two 1/2" bolts to 75 ft. lbs. torque once head angle is set. Surge brake actuators not designed for use with a weight distributing hitch may bind and not operate freely. Check your surge brake operating instructions for any specific requirements regarding their use with weight distributing hitches.

Remove hitch when not towing

Remove weight distribution hitch from the trailer hitch on towing vehicle when not towing a trailer to reduce chances of striking weight distribution hitch on the driveway or other objects. This also reduces the chance of parts being stolen.

Towing vehicle and trailer manufacturer's recommendations

Review the owners manual for your towing vehicle and trailer for specific recommendations, capacities and requirements.

Pole tongue trailer

If your trailer has a straight (pole) tongue, instead of an A-frame tongue, as shown in the illustrations in this instruction manual, it will be necessary to use a pole tongue adapter for hook up of the weight distributing hitch lift brackets.

Passengers in trailers

Trailers should not be occupied while being towed. Most states enforce this regulation.

Trailer lights, turn signals and electric brakes

Always hook up all of the trailer lights, electric brakes and break-away switch connections whenever trailer is being towed.

Tire inflation

Unless specified by the towing vehicle or trailer manufacturer, tires should be inflated to their maximum recommended pressure.

At the beginning of every tow day

Coat the clevis pins in head assembly with a fibrous grease.

Clean ball and coupler socket. Coat ball lightly with grease.

Check spring bar chains and U-bolts for wear and security. Replace if they become worn.

Check to see that all trailer balls are properly tightened and that the locking pins in the lift brackets are securely in place. Also, check that the hitch pin is in place and secure.

Check to see that all electrical hook-ups are in working order and that the security chains are securely connected.

NOTES

Some states require a clear view of license plates. Remove trailer ball when not in use if it restricts view.

This product complies with regulation V-5, C.S.A. Standard D-264 and safety requirements for connecting devices and towing systems of the State of New York.
